# 1960s/1970s- Outline analysis

**A.****B.**

$$A_n = \frac{T}{2n^2\pi^2} \sum_{p=1}^k \frac{\Delta x_p}{\Delta t_p} \left[ \cos\left(\frac{2\pi n t_p}{T}\right) - \cos\left(\frac{2\pi n t_{p-1}}{T}\right) \right]$$

$$B_n = \frac{T}{2n^2\pi^2} \sum_{p=1}^k \frac{\Delta x_p}{\Delta t_p} \left[ \sin\left(\frac{2\pi n t_p}{T}\right) - \sin\left(\frac{2\pi n t_{p-1}}{T}\right) \right]$$

$$C_n = \frac{T}{2n^2\pi^2} \sum_{p=1}^k \frac{\Delta y_p}{\Delta t_p} \left[ \cos\left(\frac{2\pi n t_p}{T}\right) - \cos\left(\frac{2\pi n t_{p-1}}{T}\right) \right]$$

$$D_n = \frac{T}{2n^2\pi^2} \sum_{p=1}^k \frac{\Delta y_p}{\Delta t_p} \left[ \sin\left(\frac{2\pi n t_p}{T}\right) - \sin\left(\frac{2\pi n t_{p-1}}{T}\right) \right]$$

Where:  $k$  = the total number of steps around the outline

$n$  = the harmonic number

$\Delta x$  = the displacement along the x axis between  
point  $p$  and  $p+1$

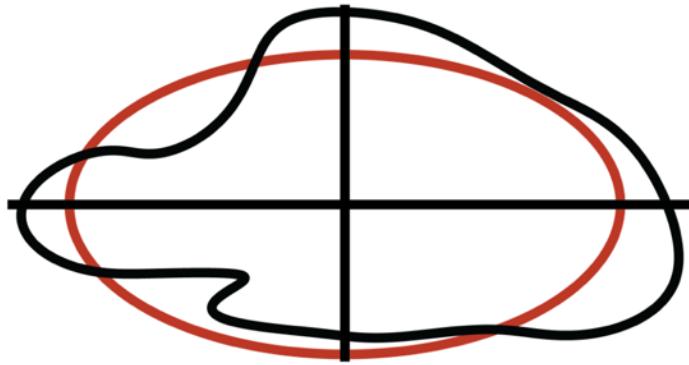

$\Delta t$  = the length of the step between point  $p$  and  $p+1$

$t_p$  = accumulated length of step segments at point  $p$

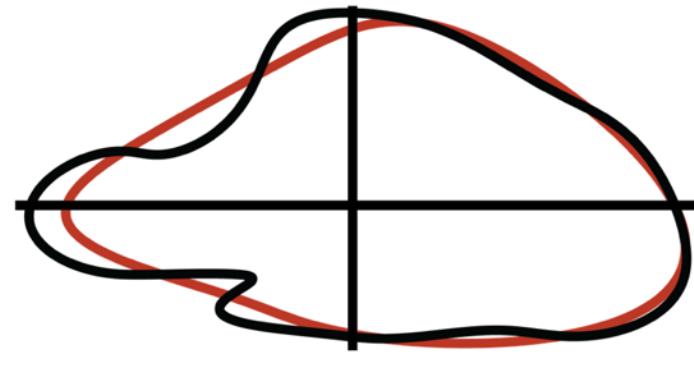

$T$  = sum of lengths of all steps around outline

# The “Revolution”: La Morphometrics

(A)

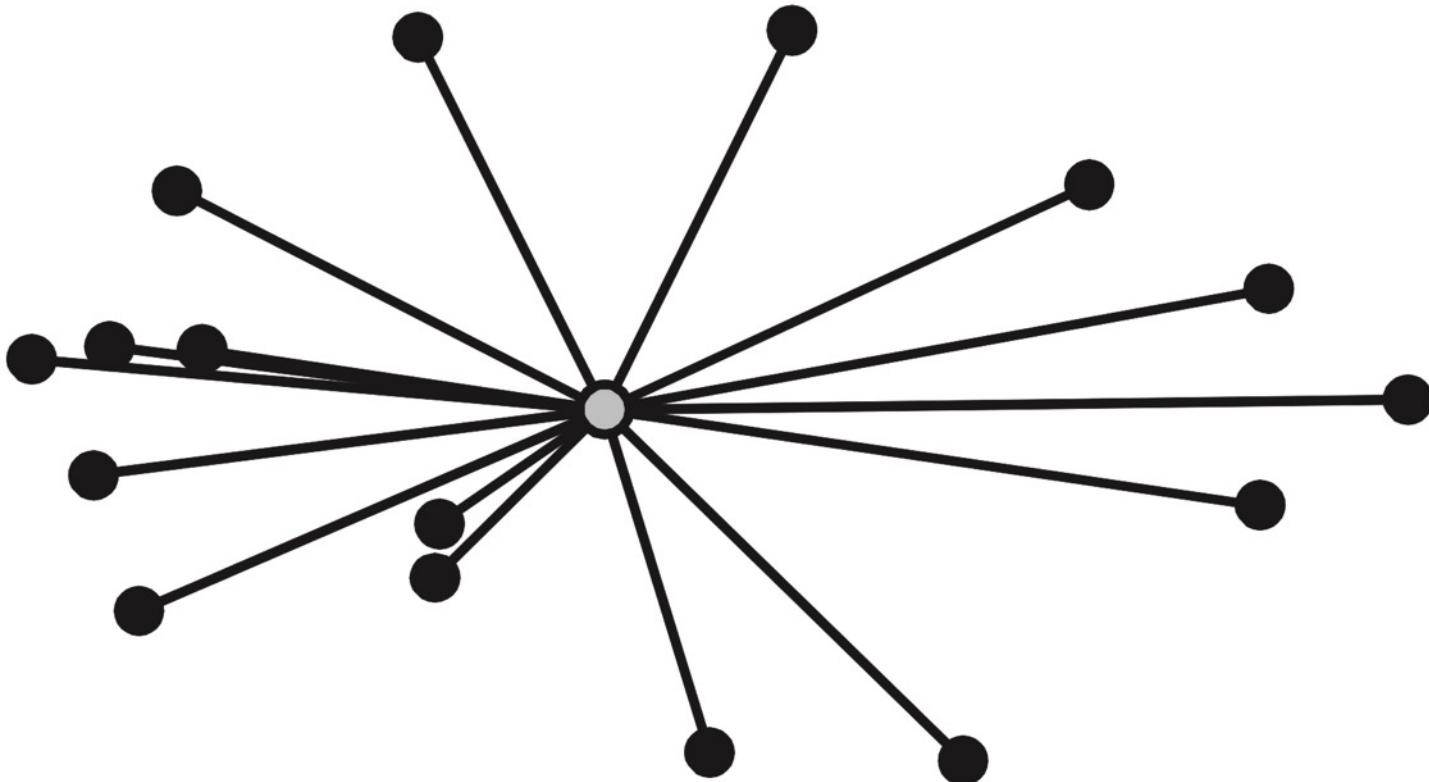

# Procrustes superimposition

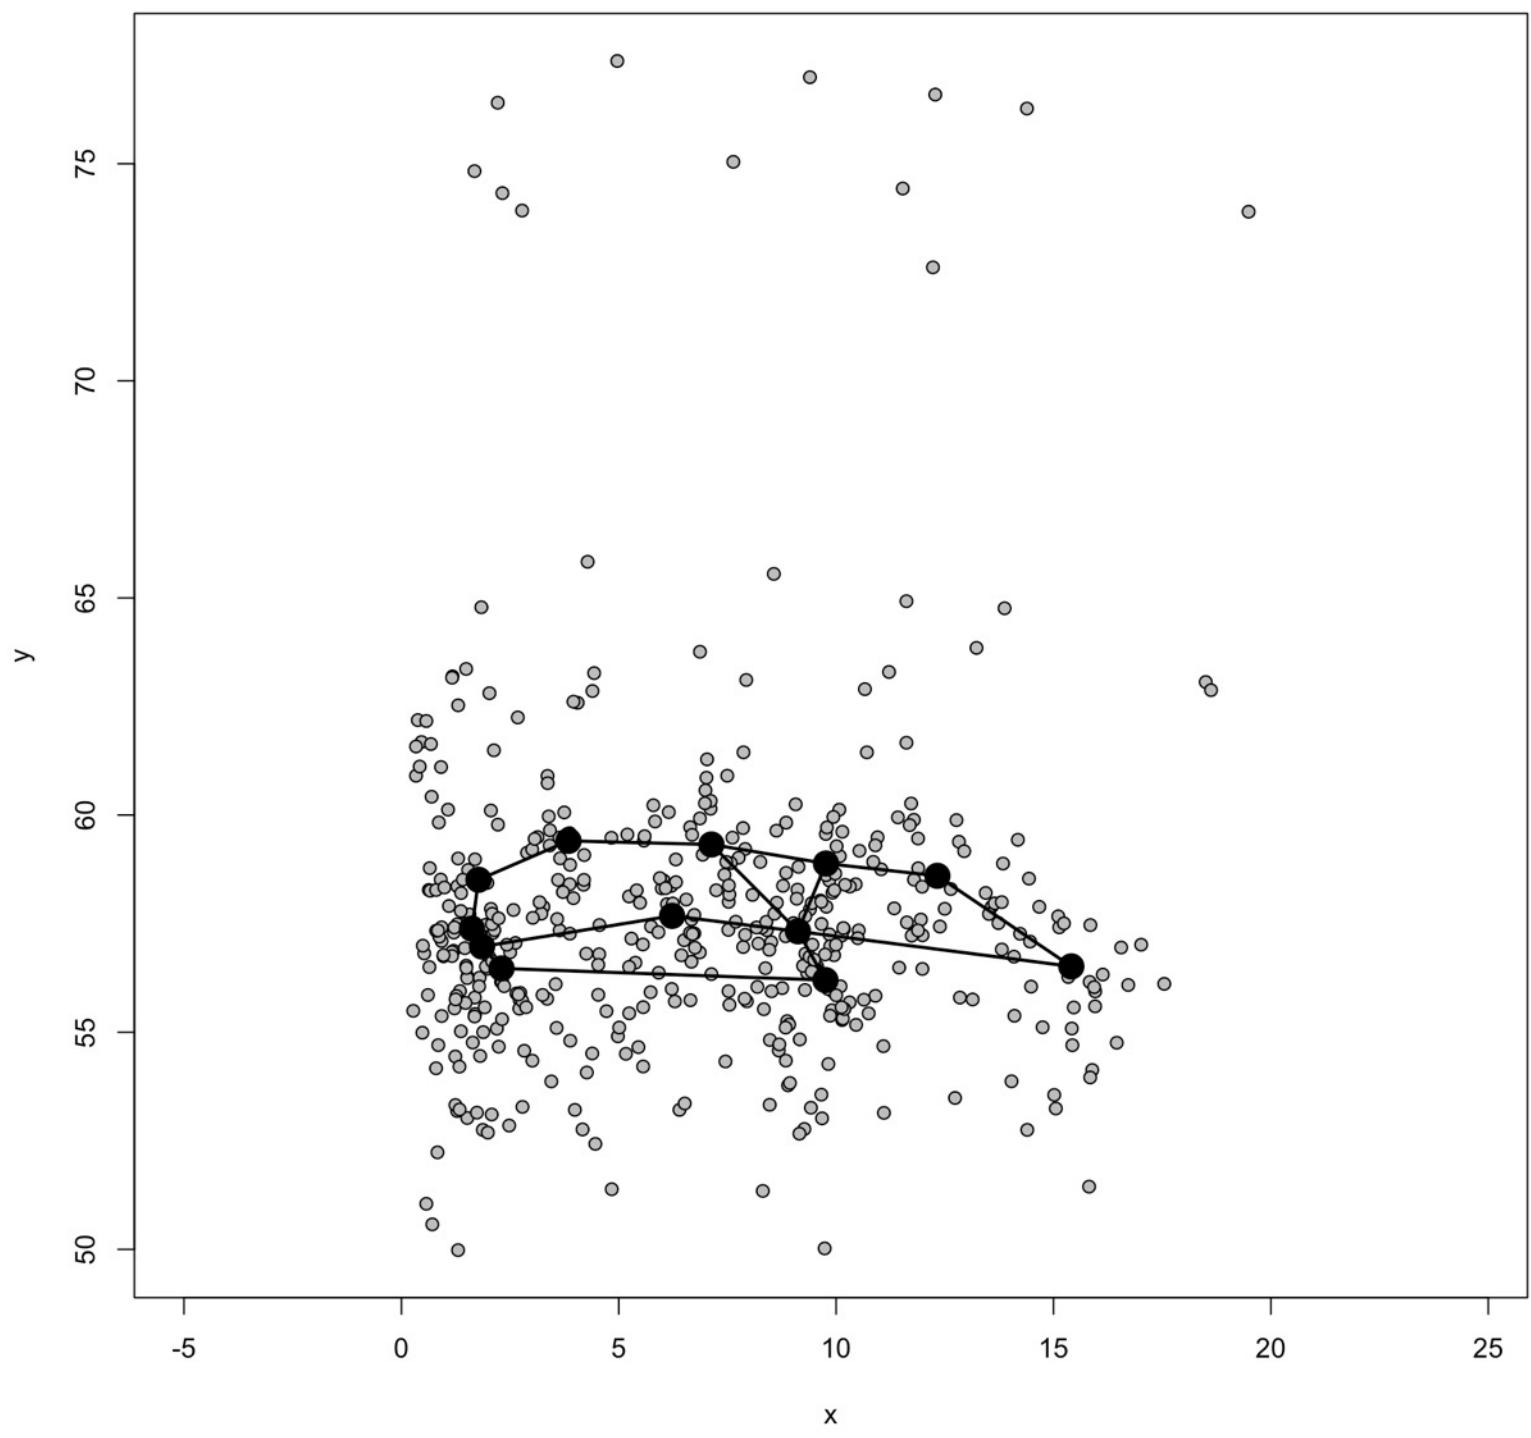

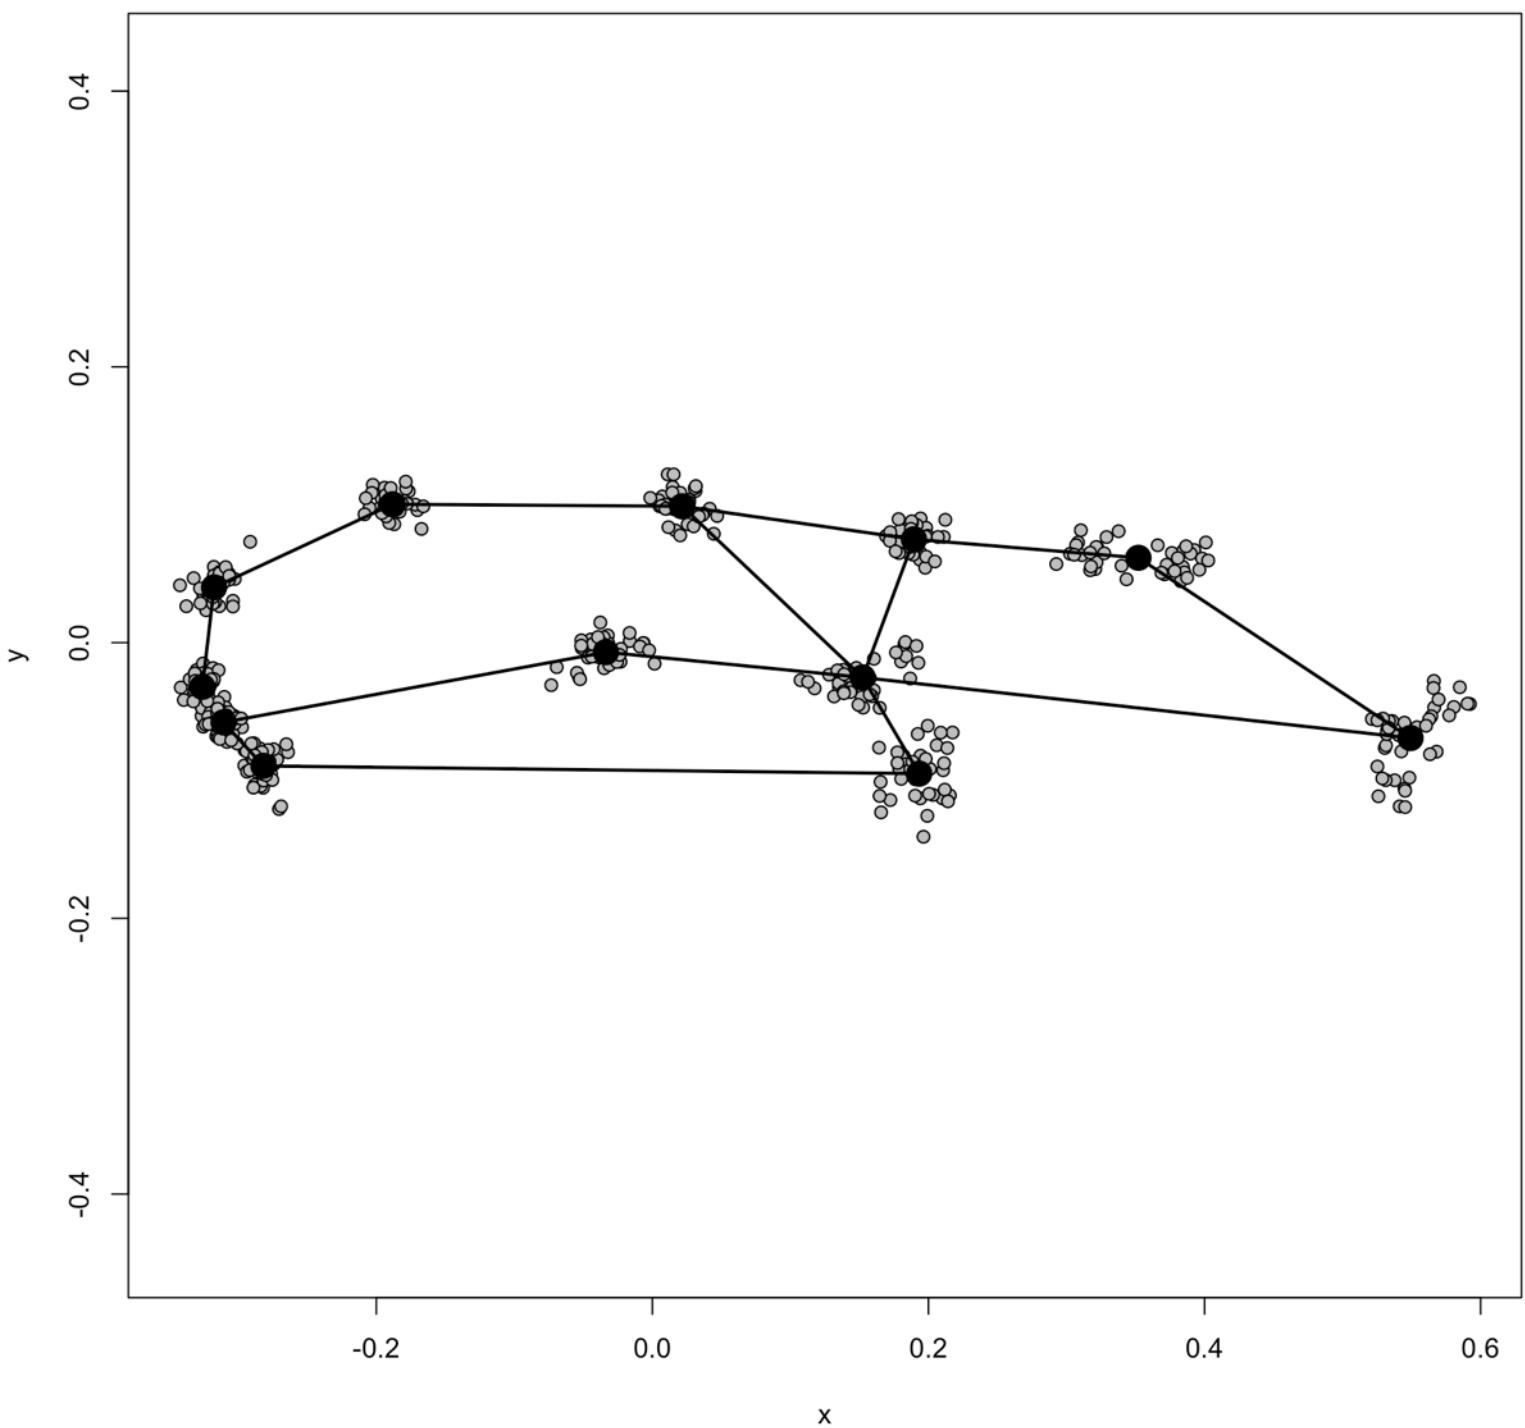

Procrustes had a stronghold on Mount Korydallos at Erineus, on the sacred way between Athens and Eleusis. There he had a bed, in which he invited every passer-by to spend the night, and where he set to work on them with his smith's hammer, to stretch them to fit. ... If the guest proved too tall, Procrustes would amputate the excess length; if the guest was too short Procrustes would stretch them until they died; nobody ever fit the bed exactly.

# What is centroid size?

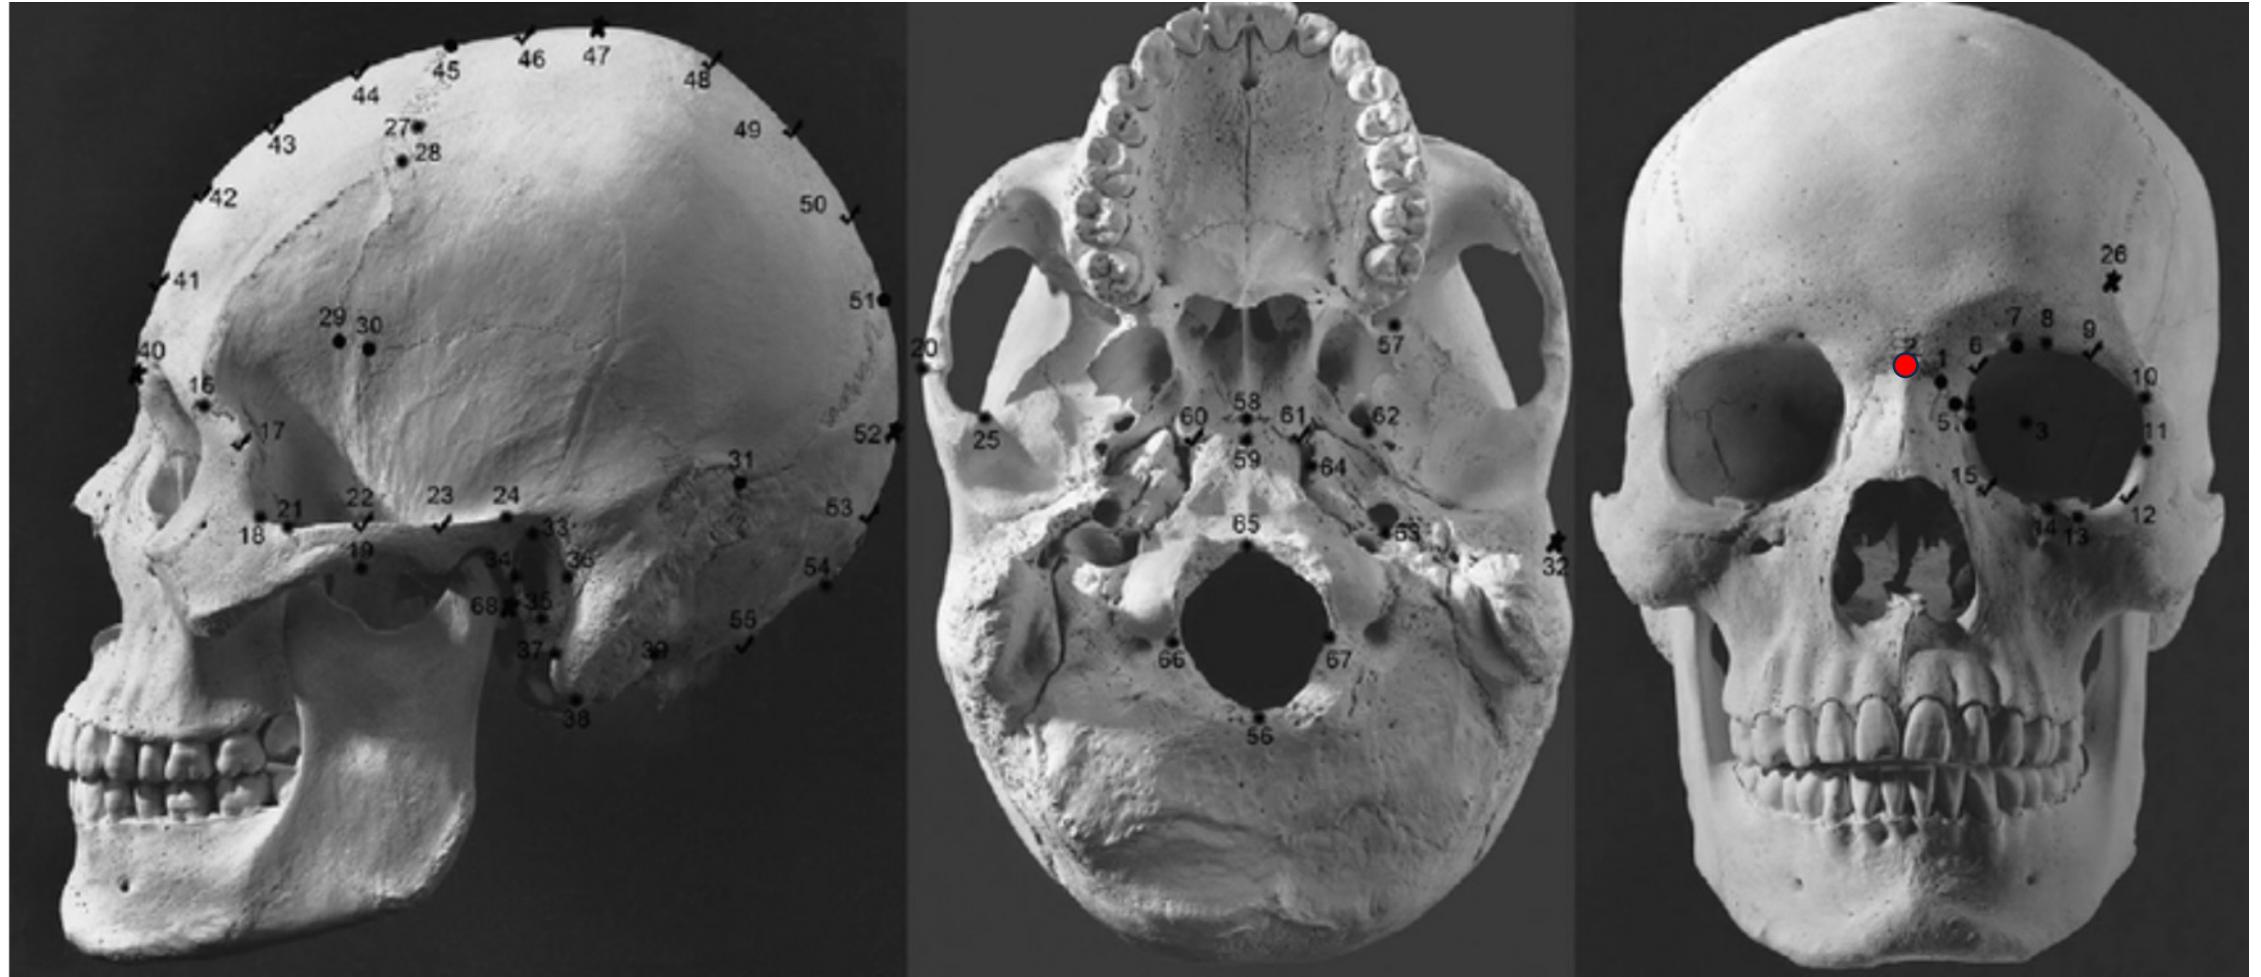

Sum of the squared distances from each point to the geometric center of all of the points

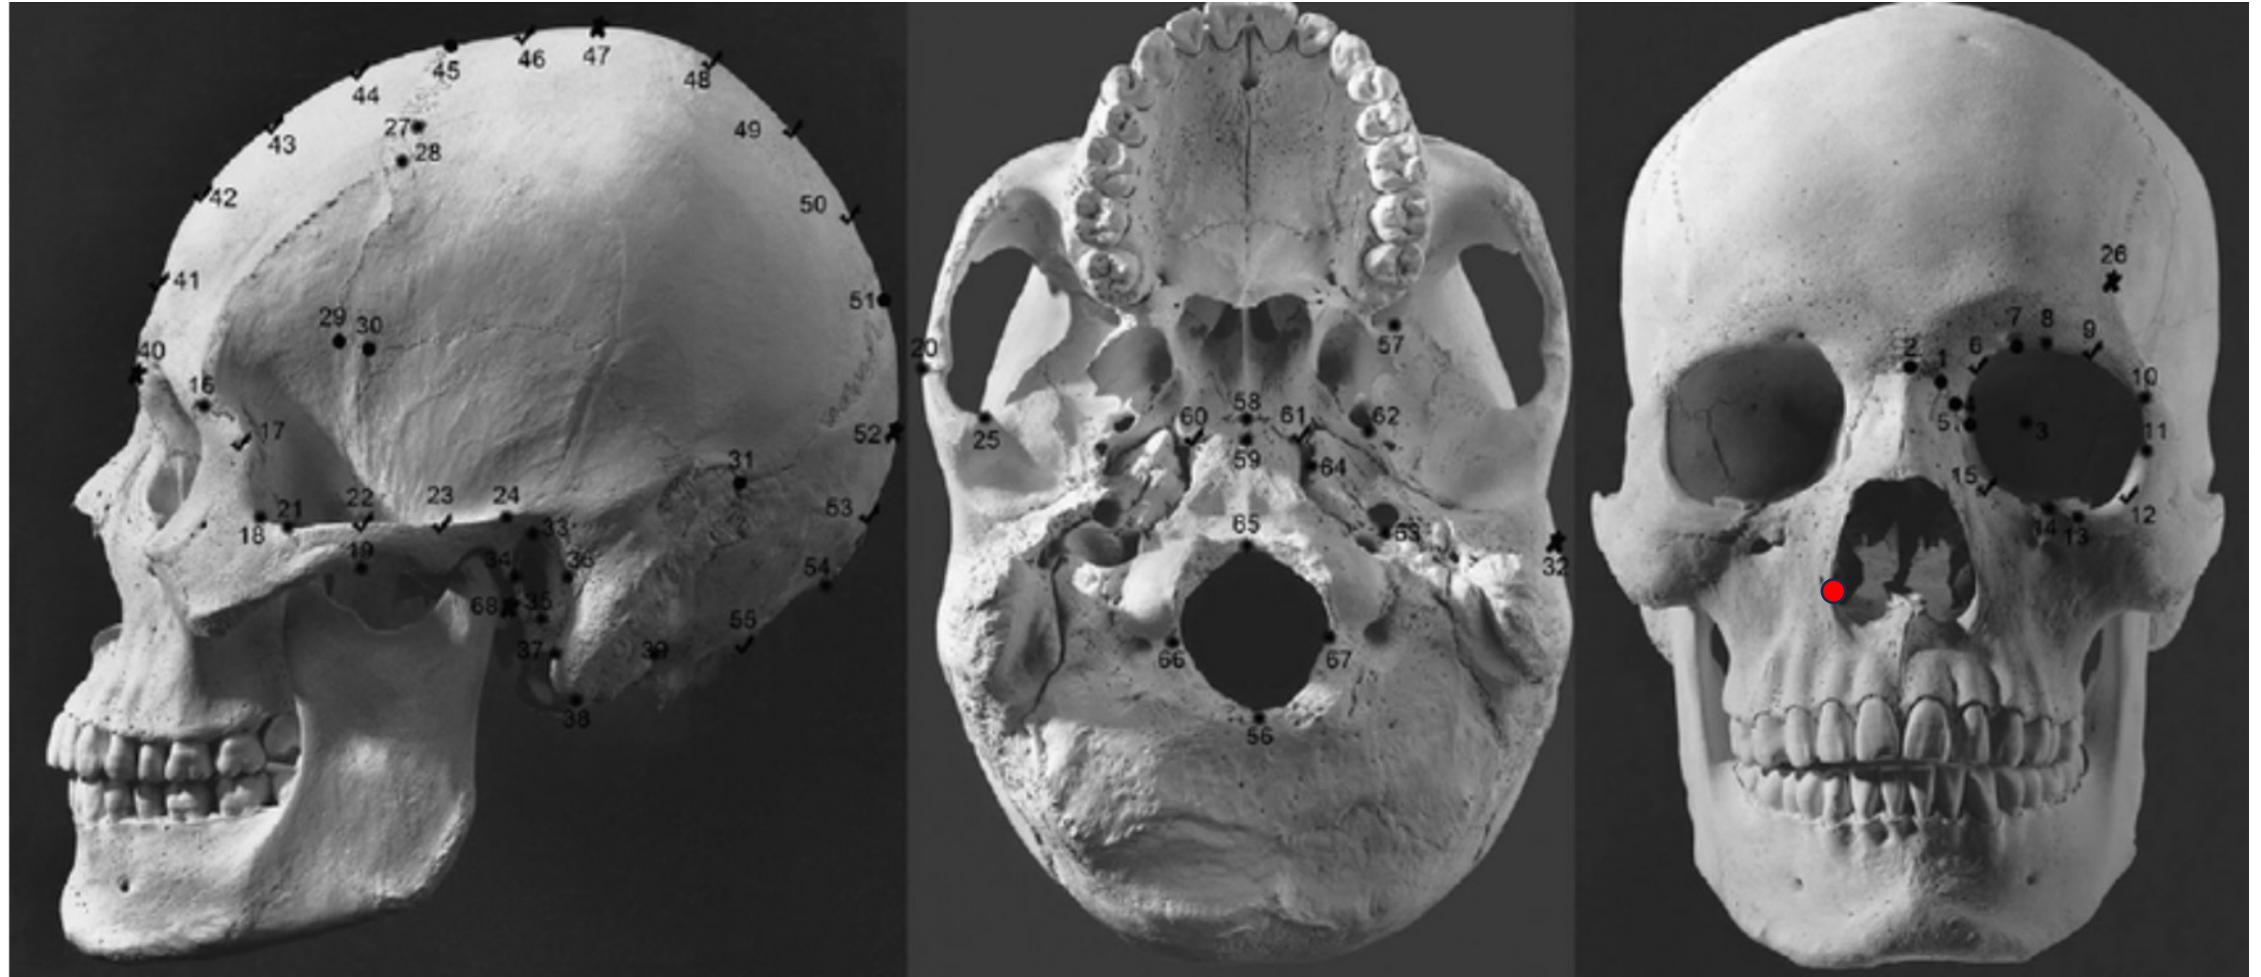

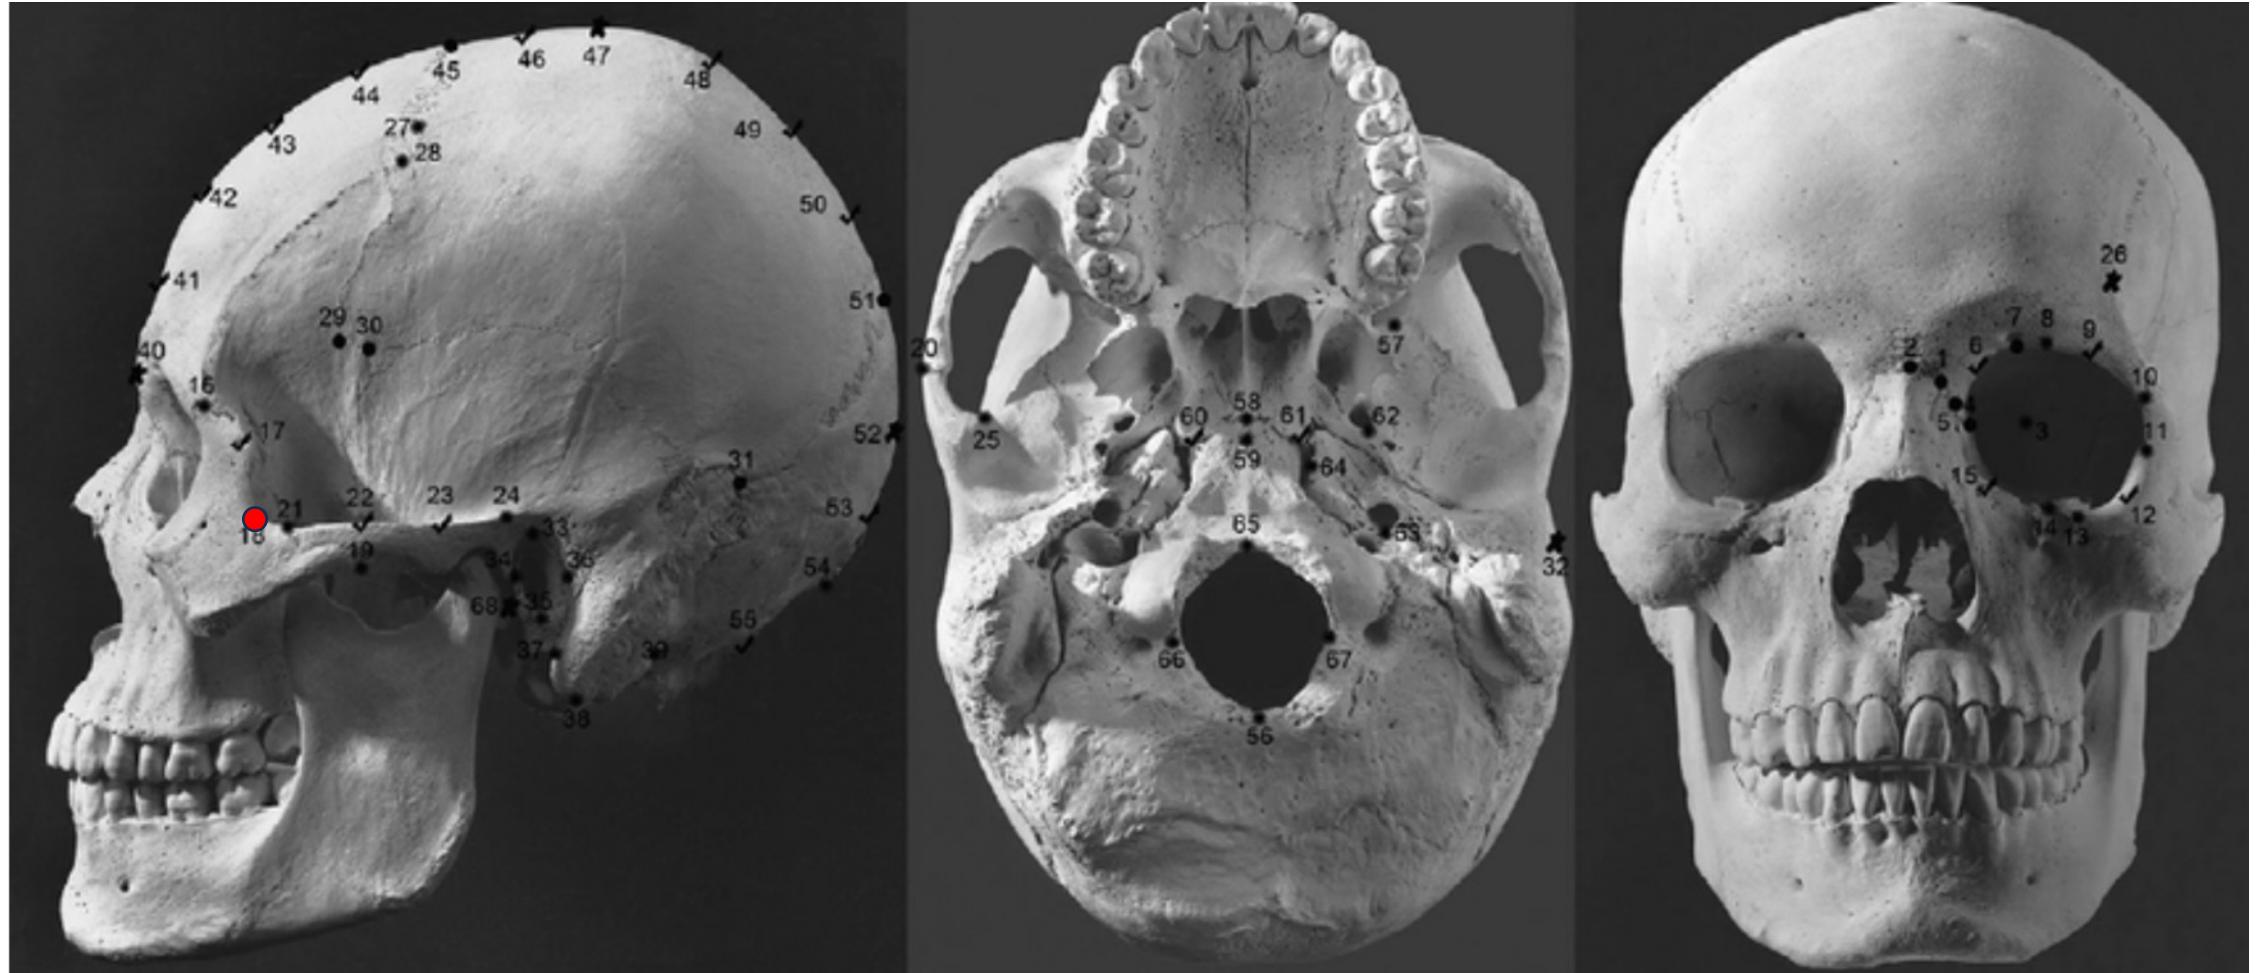

# Landmark Types (Bookstein, 1991)

- **Type 1: Anatomical:** homology is provided by biologically unique patterns on the form (e.g. intersection of three bones)
- **Type 2: Processual:** homology is provided only by geometric, not biological or histological, criteria (e.g., point of maximum curvature along a boundary)
- **Type 3 extremal:** “end-points of diameters, centroids, intersections of interlandmark segments, points farthest from such segments, constructions involving perpendiculars or evenly spaced radial intercepts, and the like”
